PENDANTS

It might look perfectly round when it's full, but the moon is actually asymmetrical. Its crust is thicker on one side than the other, and there are large masses beneath the surface of many lunar basins potentially caused by accumulations of lava. Scientists believe the unevenness and asymmetry could be a result of Earth's gravitational pull.

A modern interior scene featuring a dark brick wall. On the left, a framed abstract drawing with dark, expressive lines is displayed. Three cylindrical pendant lights with brass-colored caps and bases hang from the ceiling, casting a warm glow. Below the lights, a bronze bust of a classical figure is positioned on a surface. In the foreground, a dark sofa with cushions is visible, and a small glass of water sits on a table next to the bust.

The moon's rocky mantle is about 825 miles (1,330 km) thick and made up of dense rocks rich in iron and magnesium.

tablets

TABLE

Studies also suggest that rocks from Earth travel to the moon, and computer simulations have led scientists to believe that the moon may have asteroid debris from Earth, Venus, and Mars.

The moon's gravity pulls at the Earth, causing predictable rises and falls in sea levels known as tides.

floor basins

FLOOR

Between approximately 4.4 and 4.6 billion years ago, a magma ocean tens of kilometers deep covered the moon.

An early crust on that ocean formed what became the lunar highlands, and meteorite impact reduced that crust more, creating mountain ranges that built up between the impact basins.

While it's a satellite of Earth, the moon, with a diameter of about 2,159 miles (3,475 kilometers), is bigger than Pluto.

WALL

Unlike earthquakes, which usually only average about 30 seconds, moonquakes can go on for quite some time. These shallow tremors originate 12-19 miles below the lunar surface and last upward of 10 minutes.

The Moon is unique in that it is the only spherical satellite orbiting a terrestrial planet

outdoor pool plans

OUTDOOR

The Moon is the fifth largest natural satellite. It is much smaller than the major moons of Saturn and Jupiter at 3,475 km in diameter, but the Moon is the largest in relation to the size of the planet it orbits.
